

Incident Report: Davy Crockett Emergency Response

(Information is considered to be accurate at the time of posting, but is subject to change as new information becomes available.)

Update as of August 16, 2011

Incident duration:	202 days
Personnel Currently Assigned	34 response contractors, federal & state
Injuries	0
Total oil water mixture recovered to date	1.6 million gallons*
Total steel removed	4.29 million pounds
Debris and oiled debris removed	802,072 pounds
Bunker oil recovered	31,949 gallons
Asbestos removed	4,850 pounds
Samples analyzed to date (e.g. water, oil sediment)	218
Obligated costs to date (including coffer dam construction)	\$19.2 million
* This figure represents the amount of oily water mixture that has been recovered directly from the Barge Davy Crockett during response operations. An initial unrecovered release of an estimated 70 gallons of oil was documented on January 27, 2011 the day the vessel was discovered to be leaking oil.	

OPERATIONS UPDATE – August 16, 2011

Divers continued to cut access hatches into the remaining double-bottom tanks in preparation for removal operations that should begin later this week. The divers are encountering bunker oil that is trapped in various areas of the tanks (see photos of divers in photo gallery). Bunker oil encountered during dive operations is being collected in sorbent boom on the surface of the water inside the cofferdam.

Top-side workers removed oiled sorbent boom and continued to operate the filtration system that is treating water pumped from inside the cofferdam and then discharged back into the worksite. Some 153 gallons of bunker oil was pumped and collected from the double-bottom tanks on Monday.

ENVIRONMENTAL PROTECTION

All activities involving the destruction and removal of the Davy Crockett are designed to minimize environmental impacts. The impermeable oil and silt barrier inside the metal cofferdam along with sorbent oil collection booms have prevented tar balls and oil sheen from discharging into the Columbia River downstream of the work site. Oil containment boom is deployed outside the cofferdam as a preventative measure in case there is a release of oil from the work site. Additional on-water oil recovery resources and oil containment boom are staged nearby as further protection.

Water quality samples upstream, downstream and inside the cofferdam are being collected on a periodic basis in order to evaluate the effectiveness of work activities to minimize water pollution. After the Davy Crockett is removed, sediment samples will be collected inside the cofferdam to determine if sediment cleanup is needed before the cofferdam is removed.

Water and residual oil that is generated from pumping out holds and tanks of the Davy Crockett, plus wash water from cleaning operations and stormwater collected on the Davy Crockett and work barges is put through an on-site water filtration system. The filtered water is then stored on-site pending final disposal through the city of Portland's wastewater treatment system.

The Washington Department of Ecology has taken responsibility for the cost of the wastewater storage and disposal of the filtered wastewater that will be generated during the rest of the project. Ecology decided to take this action rather than agree to the discharge of filtered water directly back into the river, an option preferred by the Coast Guard. While the Coast Guard has consistently maintained environmental protection as a priority, Ecology determined that storing this filtered wastewater and delivering it to an upland treatment system provided the highest level of protection of the river and is consistent with Washington State water quality program requirements.

DAVY CROCKETT HISTORY

The Davy Crockett is a former Navy Liberty Ship that was converted to a flat deck barge. As with many aging vessels, ownership has changed several times over the years. The most recent ownership change is believed to have occurred in mid-2010. The vessel is located on Washington state-owned aquatic lands.
